F Distribution Tables

The F distribution is a right-skewed distribution used most commonly in Analysis of Variance. When referencing the F distribution, the **numerator degrees of freedom are always given first**, as switching the order of degrees of freedom changes the distribution (e.g., $F_{(10,12)}$ does not equal $F_{(12,10)}$). For the four F tables below, the rows represent denominator degrees of freedom and the columns represent numerator degrees of freedom. The right tail area is given in the name of the table. For example, to determine the .05 critical value for an F distribution with 10 and 12 degrees of freedom, look in the 10 column (numerator) and 12 row (denominator) of the F Table for $\alpha=.05$. $F_{(.05, 10, 12)} = 2.7534$. You can use the [Java Applet](#) or the [HTML5/JavaScript Webapp](#) interactive F-Distribution calculators to obtain more accurate measures of probability or critical values.

Five different F-tables corresponding to alternative right-tail probabilities (α) are included below:

- [F Table for \$\alpha = 0.10\$](#)
- [F Table for \$\alpha = 0.05\$](#)
- [F Table for \$\alpha = 0.025\$](#)
- [F Table for \$\alpha = 0.01\$](#)
- [F Table for \$\alpha = 0.001\$](#)

This SOCR Wiki page provides R code of how to generate these probability tables for any distribution.
